

Dependency: each stage constrains what the next may claim.

1 Evidence and harmonisation

Admitted strands, accepted populations, units and reporting basis resolved

Untraceable evidence → quarantined

2 Risk quantification and completeness

Record-level exceedance, revisit interval, compatible linkage

Untraceable evidence → quarantined

3 Predictive reliability and transfer

Two feature channels, leakage-safe validation, external evaluation, calibration, mechanistic ablation

Failed transfer → abstain or data acquisition

4 Technology evidence and sufficiency

Exact-product identity, evidence class and source standing, admissibility

Evidence insufficient → specific evidence request

5 Conditional decision support

Archetype preference, then the applied procedure whose order is not tradeable

Support insufficient → abstain or data acquisition

Permitted terminal outputs

technology class

conditional shortlist

direct measurement required

specific evidence request

deferred named-product recommendation

Analytical compatibility is not tradeable in the applied procedure.

The framework supports decisions; it does not make them, and it certifies nothing.

No output certifies that water is safe to drink.

Framework rules

Absence of evidence is never evidence of safety

Health-based and operational thresholds are never combined

A modelled grid cell describes an area, not a well or tap

A result that weakens the framework is reported at the length of one that supports it
