

(a) Random splitting overstates spatial performance

Seven tasks, GEMStat archive

(b) Every task exceeds its no-skill baseline

Spatial-block design

(c) Model B is higher on all six shared tasks

Random-row test set

Panels a and b are the leakage-safe generalisation evidence. Panel c is a separate random-row channel comparison and is not evidence of spatial generalisation. Accuracy where the two channels agree exceeds accuracy where they disagree by 0.2363 to 0.2566 across the six shared tasks. Every plotted value is printed beside its own marker, at the precision of the source record.
